

# Polarization filters for ring lights

There are polarization filters for ring lights with 78 and 102 mm diameter available.

The filter consists of two parts: an outer part for the ring light and an inner part for the camera. The outer section is fixed by three screws. The inner section is twistable in order to adjust the polarization effect.

The most used polarization filter is HN38 with a total luminous transmittance of approximately 38% and it's noted for the lack of color distortion.

The filter ring is made of black aluminium. Other types of polarization filters on request.

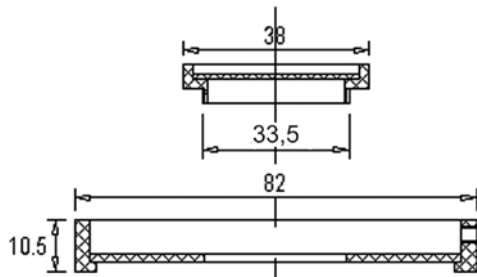

## Order information

| Order number | Design                            |
|--------------|-----------------------------------|
| LFL3 1078    | polarization filter for SAX3 1078 |
| LFL3 1102    | polarization filter for SAX3 1102 |

Other types and custom designs on request.
